CLAIMS:

1. A continuous belt casting apparatus, comprising a casting cavity, at least one flexible metal belt having an elongated casting surface passing through and at least partially defining the casting cavity, a motor for  
5 rotating said at least one metal belt in a longitudinal direction of said casting surface whereby said casting surface passes through said casting cavity in said longitudinal direction, and a molten metal supply device adapted to deliver molten metal continuously to the casting cavity, whereby molten metal supplied to the casting cavity is solidified and removed as a continuous strip  
10 ingot from said casting cavity by rotation of said at least one belt, wherein said casting surface is provided with a plurality of grooves oriented in substantially the same direction.
2. The apparatus of claim 1, wherein said plurality of grooves impart a surface roughness ( $R_a$ ) to the casting surface, and said surface  
15 roughness ( $R_a$ ) is in the range of 18 to 80 micro-inches (0.46 to 2.0 micrometers).
3. The apparatus of claim 2, wherein the roughness ( $R_a$ ) of the casting surface is in a range of 18 to 65 micro-inches (0.46 to 1.65 micrometers).
- 20 4. The apparatus of claim 2, wherein the roughness ( $R_a$ ) of the casting surface is in a range of 25 to 45 micro-inches (0.64 to 1.14 micrometers).
5. The apparatus of claim 1, wherein said at least one casting belt is made of copper or a copper alloy.
- 25 6. The apparatus of claim 1, wherein said at least one casting belt is made of aluminum or an aluminum alloy.
7. The apparatus of claim 1, wherein the casting belt is made of steel.

casting surface, and said surface roughness (Ra) is in the range of 18 to 80 micro-inches (0.46 to 2.0 micrometers).

16. The method of claim 15, wherein the casting surface is provided with grooves that impart a surface roughness (Ra) to the casting surface in a  
5 range of 18 to 65 micro-inches (0.46 to 1.65 micrometers).

17. The method of claim 15 wherein the casting surface is provided with grooves that impart a surface roughness (Ra) to the casting surface in a range of 25 to 45 micro-inches (0.64 to 1.14 micrometers).

18. The method of claim 14, which comprises providing said at least  
10 one casting belt made of copper or a copper alloy.

19. The method of claim 14, which comprises providing said at least one casting belt made of aluminum or an aluminum alloy.

20. The method of claim 14, which comprises providing said at least one casting belt made of steel.

15 21. The method of claim 14, which comprises orienting said plurality of grooves in a direction within 45 degrees of the longitudinal direction of the casting surface

22. The method of claim 14, which comprises orienting said plurality of grooves substantially in the longitudinal direction of the casting surface.

20 23. The method of claim 14, which comprises providing two belts to define said casting cavity.

24. The method of claim 14, which comprises supplying molten aluminum or aluminum alloy to said casting cavity as said molten metal.

25 25. The method of claim 14, which further comprises supplying an at least partially volatile liquid parting agent to said casting surface before contacting said casting surface with said molten metal.

surface.

36. The casting belt of claim 28, wherein the grooves are oriented substantially in the longitudinal direction of the casting surface.
